

Manage your health with HIV self-test

HIV self-testing is an antibody test, which can take 23 to 90 days (about 4 to 12 weeks) to detect HIV infection after exposure.

How Often Should You be Getting Tested for HIV

More information on screening and other services

1. Sexually active: get tested for HIV at least once.
2. Unprotected sexual intercourse: be tested at least once a year.
3. For those at higher risk (e.g. sharing needles, multiple sexual partners, drug use, and STD): get tested every 3 to 6 months.

Report your test result online to receive a coupon for a free self-test kit or enter a lucky draw!

Seeking for help

- ★ Anonymous
- ★ Phone or online consultation available

Present a photo of your test kit serial number at the clinic to receive an exemption for copayment and registration fee for the clinic visit and a refund of \$200 for the test kit.

- An positive result (antibody positive) means you may have been infected with HIV. You need to follow up with a health care professional to confirm the test result. It is recommended that you visit an HIV designated hospital for further confirmation test even when you are asymptomatic.

Negative result

- This may be in the window period. It is recommended that you avoid high-risk events and perform regular testing.
- To prevent infection, please use condoms consistently and use water-based lubricants. Do not share needles, or use thinners or drugs. Alternatively, use pre-exposure prophylaxis (PrEP).

PrEP is a medication proven to be effective for preventing HIV when taken following a physician's assessment. Please scan the QR-code for more information.
